

ABSTRACT OF THE DISCLOSURE

A skeleton for an umbrella includes multiple sets of rib members, each of which includes a main rib, a first link
5 connected to the main rib, and a stretcher connected at an outer end to the first link. Two opposite sets of the rib members are further provided with a second link connected to a near outer end of the main rib, an elastic first ear-forming rib connected at an inner end to the
10 second link, and a pull cord connected at an inner end to a near outer end of the stretcher and at an outer end to an outer end of the first ear-forming rib. The ear-forming ribs are pulled by the pull cords into curved and tense state to look like two ears at two sides of
15 an animal's head when the umbrella is stretched, and flatly bear against the skeleton when the umbrella is collapsed.
